1 USACE LETTER OF INTRSTRUCTION - "Local Distribution Point Planning"

June 7, 2005

SUBJECT: Local Distribution Point Planning for Commodities

- **1.1 Purpose:** The purpose of this document is to provide state, local and tribal agencies guidance when planning for distribution of emergency supplies and commodities to the public. This guidance centers on local distribution points where the commodities are placed into the victims' hands.
- **1.2 Introduction:** The US Army Corps of Engineers (USACE) provides predictive models of commodity needs based on hurricane winds, track of the storm, population density, and estimated number of residences without power. These models predict people "in need." This fact is very important for determining the amount of commodities that may be required; however, this fact is useless if commodities can't be placed into the victims' hands in a timely manner. The 2004 hurricane season proved that the ability to <u>distribute</u> commodities to the public is the controlling factor to determine supply, not the people "in need" as the models show. To successfully accomplish the commodity distribution mission, we must literally "begin with the end in mind." The successful execution of a distribution plan is essential for success. The plan must have pre-determined locations of distribution points, layout plans for each point, and must include equipment and manpower requirements.
- **1.3 Overview:** The type and quantity of supplies that the public will need in the aftermath of disasters or other crises will vary due to many factors and no one event will be just like another. Experience in emergency response over the years suggests some common necessities that the public will require to meet health, safety, and lifesaving needs. They include potable water (usually bottled), packaged ice, Meals Ready to Eat (MRE) and other supplies. In small scale disasters and in the initial hours of larger disasters, these commodities are often supplied by state and local governments, donations from industry, and volunteer agencies. When the need for commodities exceeds the state's capability, under a Presidential Declaration, the state can request that FEMA provide the additional requirements. FEMA will provide commodities stored in bulk quantities at regional logistics centers in various locations and, if needed, task ESF#3 (USACE) to purchase additional quantities of ice and water. The FEMA/USACE provided commodities are delivered from the federal staging areas to state logistical staging areas where the state inturn supplies the local distribution points. These commodities and supplies are most often delivered in over-the-road tractor trailer loads. Since these types of trucks (eighteen wheelers) are eighteen to thirty feet long, with a trailer that is forty-five to fifty-two feet long, large open areas are required to accommodate the vehicles with their loads. Distribution points must be areas that are paved, concrete, or gravel hard-stand that can withstand loads that are at load limits of national roadways. In addition to the area needed for the trucks, planning must include area for unloading, dumpsters, proper traffic flow, stockpiles, and ingress and egress for the distribution to the public. Figure 1 below shows the general flow of commodities from Federal to State to local distribution points.

1.4 Key Background Information: We live in a "just in time" world. The vendors that supply bottled drinking water, packaged ice and other commodities are geared to supply their normal business clients. They minimize storage costs and personnel costs by keeping production in line with demand. In large response efforts, packaged ice and water are provided from all over the US and Canada in order to meet the immediate demand. The same is true with the trucking Industry. Large, over-the-road trucks are seldom idle and are in business to serve clients. This is especially true of refrigerated vans which are in high demand. When disaster strikes, the Commercial world has to change their normal business structure to provide support to the effort. Vendors have to continue to support their normal customer base and gear up operations to support disaster requirements. This process, by rule of thumb for large orders, takes 48 hours during the weekday to deliver up to 50 loads and 72 hours to deliver up to 50 loads if initiated on a Friday after 12:00 noon. Because of these factors, the pre-positioning of commodities for a pending event is crucial.

A. In past responses, the industry has been impacted by large orders being cancelled and then re-ordered the next day. You can imagine the whiplash to their additional personnel, bottle suppliers, delivery schedules, trucking assets, and existing customers, that this can cause, especially on a weekend when they normally are not working. We will never eliminate this type of situation, but we as responders need to understand the repercussions to our business partners. Another re-occurring impact is to the trucking industry. When large numbers of trucks sit for 4 or 5 days at a staging or distribution site without being off-loaded, there is a huge impact on re-supply, costs, and can result in trucking companies refusing to participate in future efforts. Planning efforts must include ways to off-load trucks quickly to free up this limited resource. It's better for the victims of a disaster to have a little ice melt at a distribution point than to hold the refrigerated truck and keep it from delivering another load.

- B. Another key aspect of commodities planning is the understanding of the "pipeline effect". The need for commodities is directly proportional to commercial power. If the power is out, the need is there. When the power returns (with the exception of a contaminated water supply) the need is gone. During response operations the power restoration process must be closely monitored and commodity supplies adjusted. The pipeline is defined as all the commodities purchased but not yet delivered and all the supply trucks that are in route between the supplier and the distribution points. In large operations this number can be in the hundreds and if the power grid suddenly comes on line, then the trucks and commodities in the pipeline will represent excess stockage. The pipeline effect will most always happen, but we as managers must reduce the effect as much as possible through planning, communications, and coordination.
- C. Distribution Points provide a great place to communicate to the public by means of informational handouts. Community relations personnel are included in the distribution resource plan. The key is to have the information packaged in a handout format to prevent people from exiting their vehicles. Maximum vehicle flow is crucial to reaching as many people as possible.
- **1.5 Planning Factors:** The following are general information and common planning factors that, if used by all, will help in coordinating and communicating during the planning and response process.

A. General Information:

Ice: 8 lbs (1bag) per person per day

40,000 lbs per truck load

20 Pallets per truck, 2000 lbs per pallet, 250 – 8 lbs bags per pallet, 5000 bags per

truck

25 Trucks = 1 million lbs

Water: 3 liters or 1 gal per person (3.79 liters per gal)

18,000 liters or 4,750 gal per truck

20 Pallets per truck, 900 liters per pallet, 237 gal per pallet, 1900 lbs per pallet

212 Trucks = 1 million gal

MREs: 2 MREs per person per day

1,744 MREs per truck load

12 MREs per case, 1812 cases per truck

46 truck loads = 1 million MREs

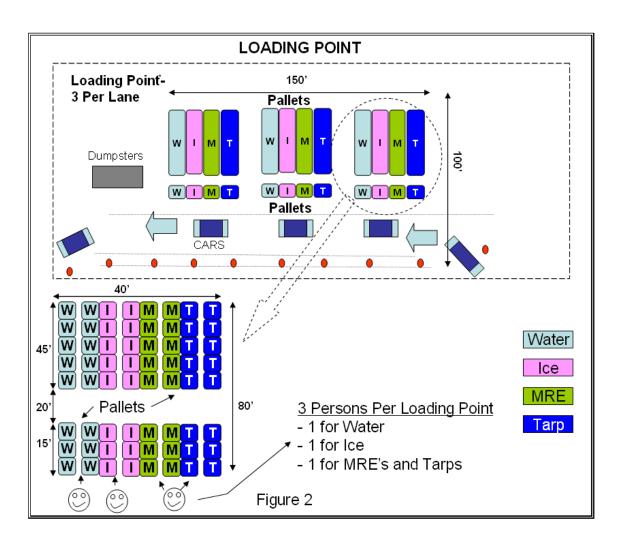

Tarps: 4,400 tarps per truck load

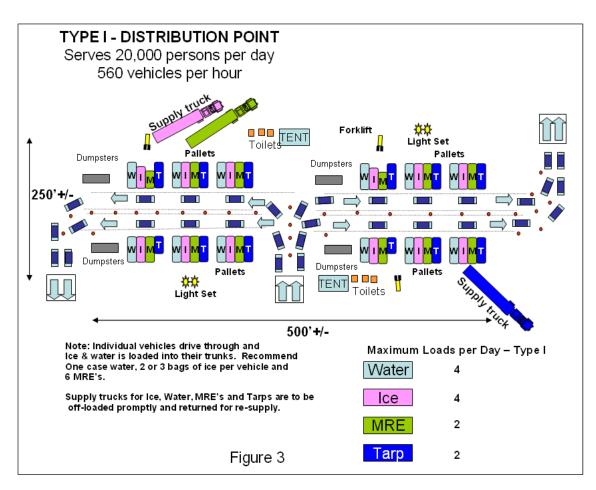

Tarp size is generally 20' x 25'

- B. Shelters and Mobile Kitchen Requirements:
 - 1. Shelters will require a mixed load of commodities consisting of 3 pallets water, 1 palletice, 1 pallet MREs per 500 person facility.
 - 2. Mobile kitchens require 2 trailers water and 1 trailer ice per 10,000 meals per day persite.

- C. Distribution Point Planning: The following are assumptions used for distribution planning:
 - 1. Victims will drive through a distribution point and be served without leaving their vehicles.
 - 2. Each car represents an average family of 3.
 - 3. Each vehicle passing through a distribution point will receive the following:
 - a. 2 or 3 bags of ice
 - b. 1 case of water (9 12 liters)
 - c. 6 MREs
 - d. 1 tarp
 - 4. 1 truck load of ice and water will serve 1,660 vehicles or about 5000 people
 - 5. 1 truck load of MREs will serve 3,624 vehicles or about 10,000 people
 - 6. 1 truck load of tarps will serve 4,400 vehicles or about 4,400 homes
 - 7. Distribution points will be open to the public for 12 hours per day.
 - 8. Re-supply of distribution points will primarily be at night (while the point is closed to the public).
- D. A loading point is where a stockpile of ice, water, MREs, and tarps are located. Each loading point has a team of people (1 for water, 1 for ice, and 1 for MREs/tarps) that load these items into the vehicle as it stops in front of their position (see Figure 2).
- E. Projected Distribution Planning Rates: Based on past experience, a well planned and operated distribution point with one lane of traffic and 3 loading points can service 140 cars per hour. Based on a 12 hour work day, about 1,680 vehicles or 1,680 x 3 = 5000 people can be served.
- **1.6 3 Types of Distribution Points:** There are three types of commodity Distribution Points. A Type I DP is the most robust and serves the most amounts of people.
 - A. Type I DP: Serves 20,000 people a day 560 vehicles per hour. (Figure 3)
 - 1. Resources required to operate Illustrated in Figure 4
 - B. Type II DP: Serves 10,000 people a day 280 vehicles per hour. (Figure 5)
 - 1. Resources required to operate Illustrated in Figure 6
 - C. Type III DP: Serves 5,000 people a day 140 vehicles per hour. (Figure 7)
 - 1. Resources required to operate Illustrated in Figure 8

1.7 Layout Plans for Distribution Points: The following plans provide examples of different sizes of distribution points and the resource required for their operation.

Figure 8

- **1.8 Planning Methods:** This section will discuss methods to determine the location and number of distribution points (DP), provide suggestions for supplying manpower and equipment resources, and discuss distribution point operations.
 - A. Determining the Location and Number of DP: The number and general location of most DPs will be determined by population; however most tribes, municipalities, and/or major communities will require a DP and, in some cases, several DPs
 - 1. The number of DPs can be determined mathematically. The Excel model shown in Appendix 1 will calculate the number of DPs required when the total number of people without commercial power is entered. The model uses a 40% factor to calculate the estimated number of people that will visit a DP. This figure is an estimated average percentage based on past experience. The model also considers only Type III DPs which consist of a one lane operation. A Type III DP provides for 5000 people and can handle one truck load of ice and water per day along with MREs and tarps. Therefore, for every truck load of ice or water ordered, there should be a corresponding DP or lane for off-loading. The number of actual DPs can be lowered if Type I or Type II DPs are used; however, the number of "lanes" will remain the same. For example; if the model computes 32 Type III DPs, then that would equal 16 Type III and 8 Type II; or 16 Type III, 4 Type II and 2 Type I; all equaling 32 lanes.
 - 2. Another method for determining the number and location of DPs is through Geographical Information Systems (GIS). GIS can produce a dot density map that provides a visual dot for a selected density of population. To determine the location of the DPs; a dot density map should be produced based on a density of one dot for every 12,500 people (40% of 12,500 = 5000, the number of people served by a Type III DP). The location of the dot will provide a general start for locating a DP; however, as stated before, consider all tribes, municipalities, and/or major communities to need at least one DP.
 - 3. The pre-planning of DP locations is critical to the public. This allows the locations of the DPs to be known to the public prior to an event before communications are impacted. This also allows for route clearing priorities and route mapping to be performed during the pre-planning process in lieu of the response process.
 - B. Resourcing DPs: DP operations, including manpower and equipment, are a local responsibility. A partnership between the community and response planners is essential for the establishment of a successful distribution system that serves the public in their time of need. The most challenging resource to provide is manpower. Most local governments depend on the National Guard, volunteer fire departments, church groups and other volunteer agencies for manpower. All of these sources are viable; however, close coordination is needed to assure local governments are not using a specific resource in multiple locations. One good example of using a local resource is the use of local churches in the disaster area. Some churches have very large parking areas that work well for a Type III DP and the church can work with their congregation to establish a ministry to man and operate the DP. This example uses people from the community to help people in the community.
 - 1. Each DP requires an equipment package. Shown in Figures, 4,6, and 8. If the disaster receives a Presidential Declaration, then the costs for renting this equipment may qualify for Federal reimbursement. It is recommended that the local emergency planning entity provide the equipment to the DPs located within their area of responsibility. Planners should work with local vendors and have agreements in place to provide the required

equipment. The rates, hourly, daily, or weekly, should be discussed with the State Emergency Management office and FEMA to get guidance on best practices. This suggested method of supplying equipment helps prevent duplication and allows for easier reimbursement.

C. DP Operations: The successful operations of a DP require a DP Team Leader or manager that understands the purpose, functions, and requirements of a DP. A successful Team Leader or manager must have the skills to motivate people, organize shifts, assure the right equipment is available, keep records on equipment usage, gather/record information on deliveries, arrange for future deliveries based on usage, and act as the primary POC for the DP with the local emergency management agency and possibly state or federal interest. Figures 11 – 14 are tracking charts that gather key information on deliveries. This information, as well as any contracts or other forms that require a signature by deliver drivers, must be acquired and maintained on file until local, State or federal officials collect it. This information is vital for documenting payment to the delivery contractors and for reimbursement purposes

1. Key checklist items for DP operations:

Adequate Manpower (Consider backups for each position)
Equipment (Forklift and pallet jack a must)
Site Layout, good traffic flow
Room for delivery trucks (18 wheelers without disrupting operations)
Qualified Forklift Operator
Security (Help with the general public)
Traffic Control (Police at main intersections)
Signs identifying the site as "Commodities Distribution Point"
Request a Community Relations person to help handout information to the public
Always keep safety first
Provide a notebook for securing delivery charts and receipts
Communications (Team Leader or manager will require communications)
Train an assistant for night operations
Ask for technical help through your Emergency Manager if assistance is needed

1.9 Commodities Planning

A. Key Lessons Learned:

- 1. Commodities will be pushed forward before logistical structures are in place.
- 2. The critical planning factor for ordering commodities is "distribution" capability, not people without power.
- 3. Distribution planning must be a priority with local governments for the commodities mission to be successful.
- 4. All levels of government must understand the distribution point concept.

B. Key Planning Factors:

1. Ice – 1 truck load (40,000 lbs, 8 lbs/per) serves 5000 people

- 2. Water 1 truck load (18,000 liters, 3+liters/per) serves 5000 people
- 3. MREs 1 truck load (21,744 ea. 2 ea/per) serves 10,000 people
- 4. Tarps 1 truck load (4,400 ea.) serves 4000 families with roof damage
- 5. 1 car represents 1 family or 3 people
- 6. Each car is provided the following:
 - a. 2 or 3 bags of ice
 - b. 1 case of water (9-12 liters)
 - c. 6 MREs
 - d. 1 tarp, if they state they have roof damage
- 7. A Type III Distribution Point with one supply lane can serve approximately 1,660 cars or 5000 people in one day.
- 8. A Type II DP has two lanes (approximately 3,300 cars or 10,000 people a day)
- 9. A Type I DP has four lanes (approximately 6,600 cars or 20,000 people a day)

1.10 USACE Point of Contact: Questions on layouts, models or other information in this document should be directed to:
