WATCHES, WARNINGS, & ADVISORIES

NWS Kansas City

NWS St. Louis

NWS Springfield

NWS Paducah

NWS Quad Cities, IA/IL

NWS Memphis
Watches, Warnings, & Advisories

Hazardous Weather Outlook (Today):

- Scattered showers and thunderstorms will be possible across the state at times during the morning and afternoon hours today. Brief heavy rainfall and cloud to ground lightning will be the main risk with any storm. Given that ground conditions are already saturated, flash flooding will be possible in some portions of the state.
- Major river flooding is ongoing along parts of the Missouri, Mississippi, and Illinois Rivers.

Days Two Through Seven:

- A cold front is expected to move into the state with chances for severe storms Tuesday and Tuesday night. All modes of severe weather will be possible including damaging winds, large hail and a few tornadoes, along with heavy rainfall.
- Some lingering chances for showers and isolated thunderstorms will be possible Wednesday and Wednesday night.
- Major river flooding is expected to continue along the Mississippi, Missouri, and Illinois Rivers.

Current Watches, Warnings & Advisories in Effect:

- Flood Warning in effect for multiple counties in Missouri.
- Flash Flood Warning in effect for multiple counties in Missouri.
- Flash Flood Watch in effect for multiple counties in Missouri.
STATE EMERGENCY MANAGEMENT AGENCY

SEMA SEOC activated at a Level 4 Enhanced Monitoring until further notice due to tornado damages and flooding throughout the state.
Scattered thunderstorms will are forming in the plains early this move and will push east into the area this morning into this afternoon. While overall rainfall amounts are not that high, it will only take a little bit of heavy rain to cause flash flooding due to the saturated ground. The heaviest rainfall will affect locations from southeastern Kansas into west central Missouri.

A complex of storms is expected to move into the area tonight. These storms will be capable of producing heavy rain which may lead to flash flooding. Monday should remain relatively quiet before widespread severe weather is expected to affect the area Tuesday. All modes of severe weather will be possible including damaging winds, large hail, a few tornadoes, and flash flooding.
A warm and unsettled weather pattern is expected through the Memorial Day Weekend. There is pretty much a chance of showers and thunderstorms through Memorial Day, however not everyone will see showers and thunderstorms, and when they occur they won’t be going on all the time. The greatest coverage and probability of showers and thunderstorms will be across the northern half of Missouri into central Illinois, while the threat of showers and storms across southeast Missouri and southern Illinois is quite low and mainly centered on Sunday. High temperatures will be above average, and up to 10 degrees above normal in spots. Memorial Day will be the warmest day will also have the lowest chances for showers and storms.
Dry weather is expected for most of today with temperatures topping out in the 70s. Rain and thunderstorms will return late tonight and linger through much of Memorial Day. Some storms could be severe with damaging winds, large hail and possible tornadoes, especially Tuesday. There will also be a continued threat for heavy rain and flash flooding.

Measles – Part 2

• From January 1 to May 10, 2019, 839 cases of measles have been confirmed in 23 states (including one case in Missouri). This is the greatest number of measles cases reported in the U.S. since 1994 and since measles was declared eliminated in 2000.

• These cases occurred primarily among unvaccinated communities and are linked to travelers exposed to measles in countries with ongoing outbreaks.

• The Centers for Disease Control and Prevention (CDC) makes the following points about measles cases occurring in the U.S.:
  − The majority of persons who have gotten measles were unvaccinated.
  − Measles is still common in many parts of the United States.
Measles – Part 2

- Travelers with measles continue to bring the disease into the U.S.
- Measles can spread when it reaches a community in the U.S. where groups of people are unvaccinated.

**On May 6, the Missouri Department of Health and Senior Services (DHSS) issued a Health Update for Missouri medical providers on measles prevention and testing recommendations. It contained the following information and guidance.**

- A summary of the increased numbers of measles cases in the U.S. in 2019 (including the fact that there has only been one case reported in Missouri, and that the state is not currently experiencing any ongoing transmission of measles virus).
- Information on virus transmission, clinical signs/symptoms, and management of those exposed.
- Guidance on measles prevention, including recommendations on infection control measures,
Missouri Department of Health and Senior Services (DHSS)

Measles – Part 2

the reporting of suspected cases to public health officials, and the use of measles vaccine. (Note that despite some media reports, there are no recommendations for additional vaccine use beyond what is currently recommended, or for special screening for immunity to measles.)

− Laboratory testing recommendations for suspected measles cases.

• Measles virus is very easily spread from person to person, and the virus can remain infectious in the air for up to two hours after an infected person leaves an area. The Health Update states that persons who have been exposed to measles should contact their health care provider if they develop cold-like symptoms with a fever and/or rash consistent with measles. They should NOT go to any health care facility without calling first to avoid potential additional exposures to others. All suspected measles cases should be kept separated from others to prevent further spread.

• If the measles situation changes in Missouri, DHSS will issue further Health Updates as needed.
